## Need better images in the rain?

IDS provides a hydrophilic solution preventing water droplets from forming on the cover glass or polymer surface. An ultra-thin, patent-pending metal layer (0.0001 mm) is applied and patterned to a glass or polymer cover lens, preventing water droplets' formation. In wet environments, the result will be a distortion-free image.

### Benefits

- **Enhanced Visibility:** Maintain clear visibility in heavy rain
- **Durability:** Long-lasting and resistant to wear
- **Raindrop Prevention:** Prevent raindrops from forming on the material surface
- **Transparency:** Greater than 90%

Contact IDS today to learn more about this solution.
